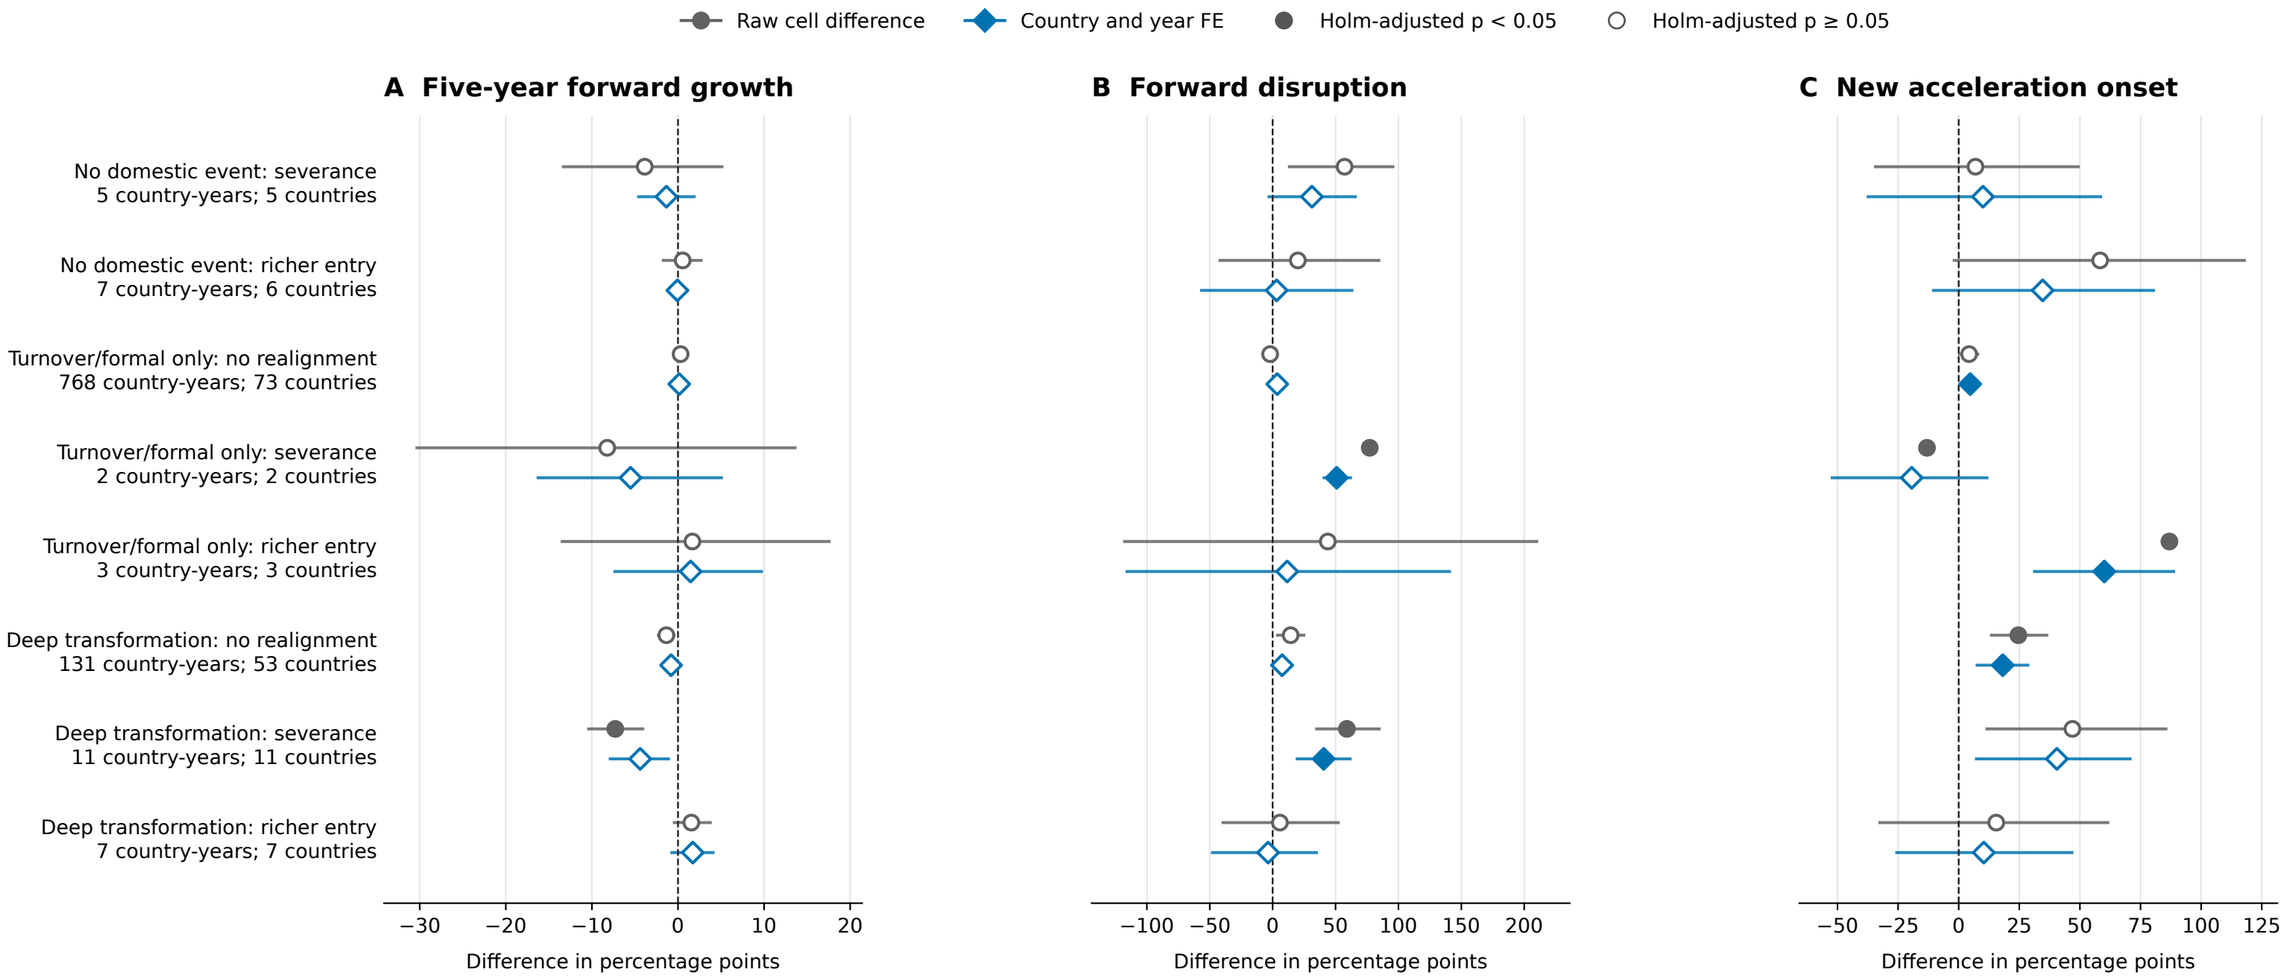
Secondary contrasts with the no-domestic-event/no-realignment cell

PRELIMINARY • Exploratory, non-causal contrasts • Start coding, current coded state, 1960–2019



PRELIMINARY. Points are differences in percentage points; lines are 95% wild-cluster-bootstrap-t intervals clustered by country, without multiplicity adjustment to interval width. Holm p-values are adjusted across 24 secondary raw or fixed-effects tests. These common-reference contrasts can combine domestic and external differences; the within-row contrasts are primary.
