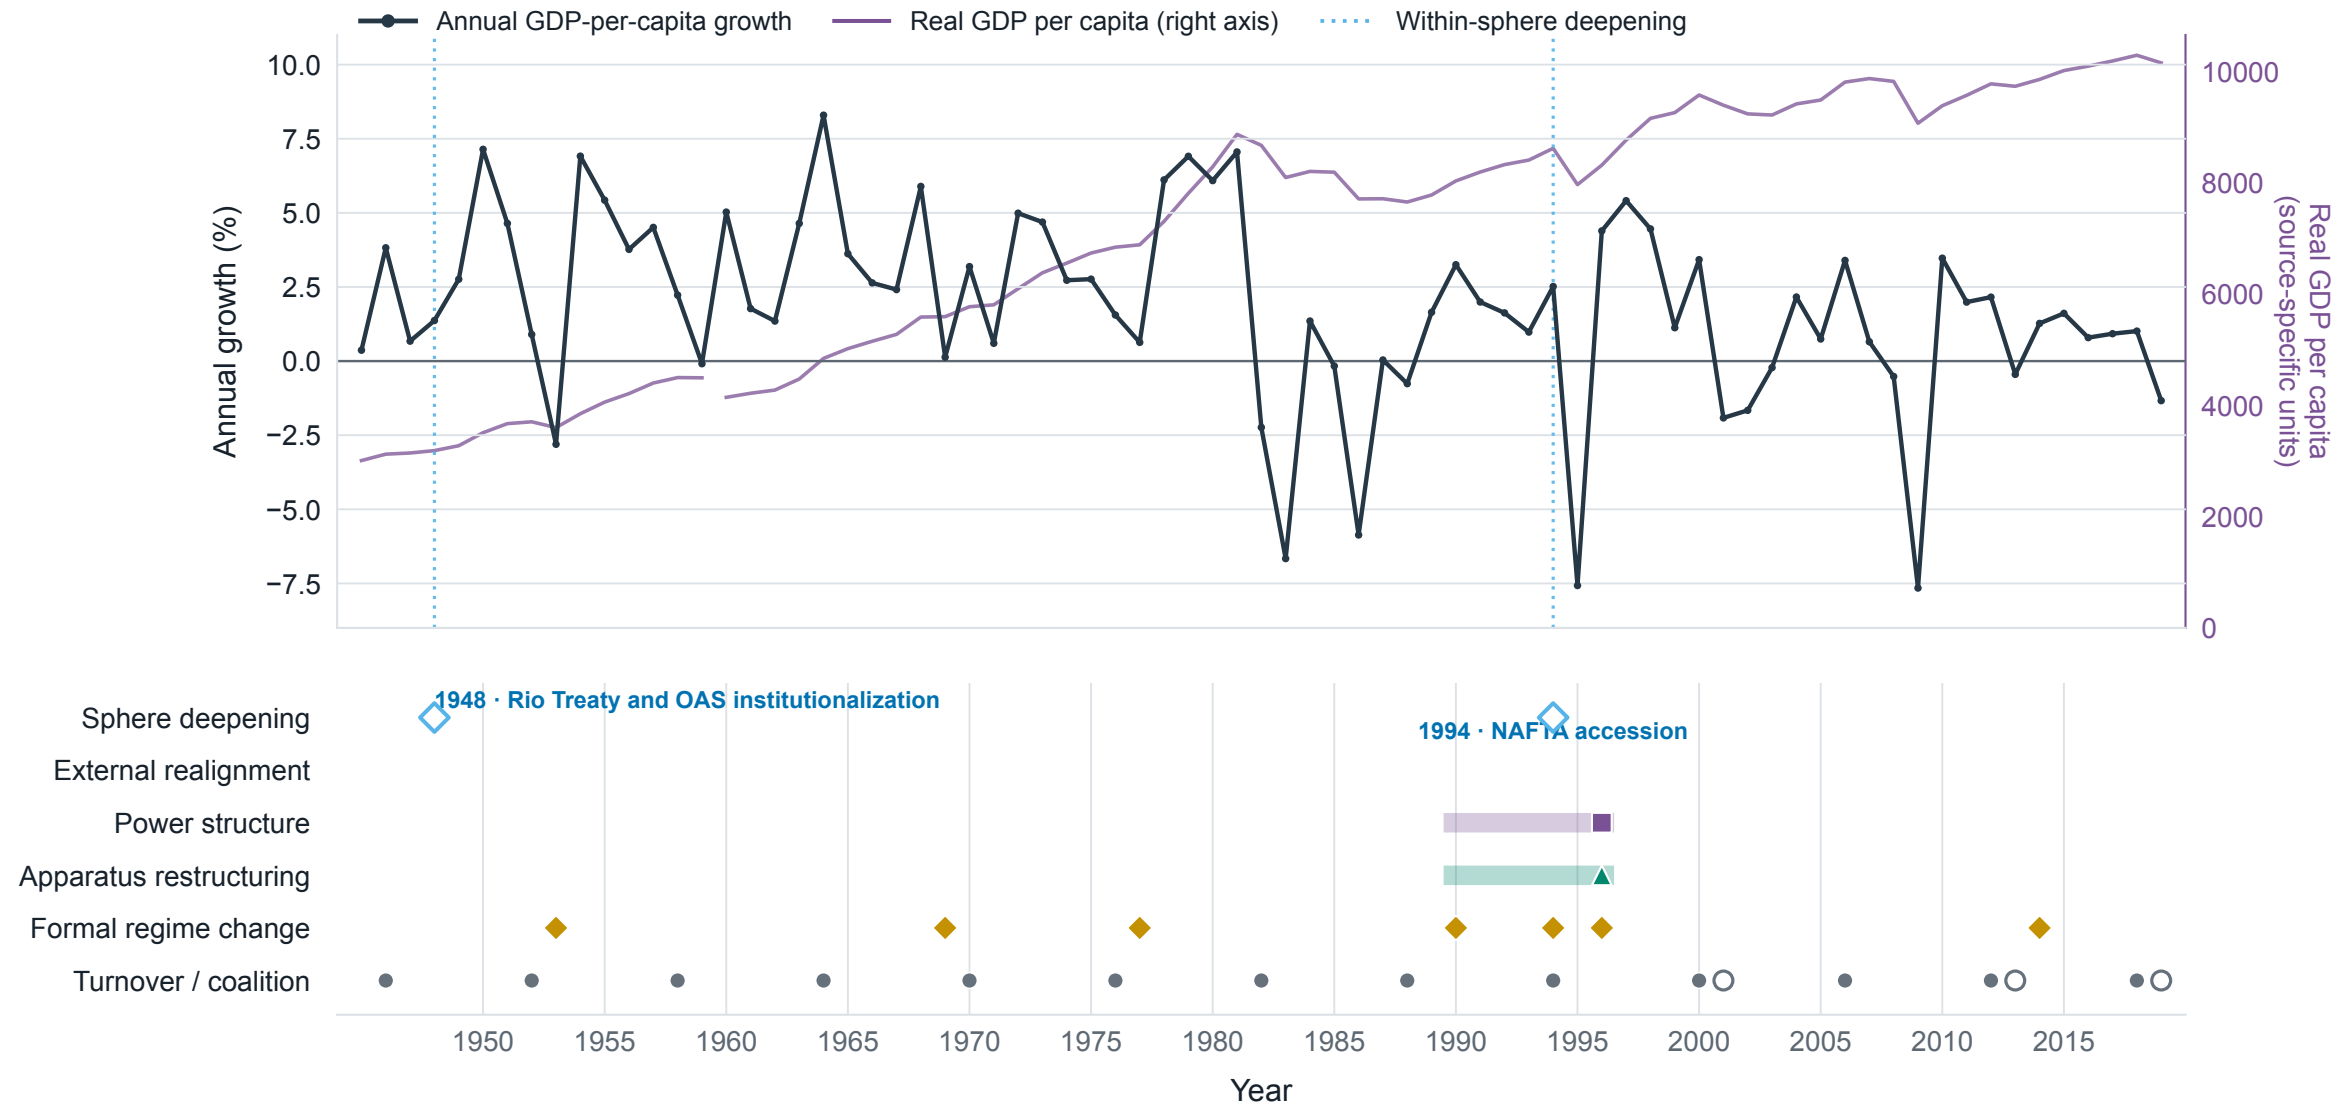
Mexico: growth and coded political events

Annual real GDP-per-capita growth and level with preliminary event coding, 1945–2019



Preliminary descriptive coding; event proximity does not establish causation. The GDP-per-capita level uses source-specific units and is broken at source seams; level jumps across sources are not comparable. Bands in the growth panel mark only disruption/acceleration episodes meeting the project's outcome thresholds. External and deep-domestic bands show process intervals; markers show start or principal event years. Dotted lines and open diamonds are separately logged within-sphere deepening, not new realignment episodes. In the bottom lane, filled circles are leader turnover and open circles are coalition change.
